 @ECVerhulst

WAGENINGEN  
UNIVERSITY & RESEARCH

# Biocontrol and evolution

# What is my (starting) population?

## Species composition

- Host plant and pest
- Origin of biocontrol population
  - Cryptic species
  - Hybridizations
    - Hybrid breakdown
- Unintended release of exotic species

## Infections

- (Endo)Symbionts
- Microorganisms
- Diseases (fungi, bacteria, nematodes)

# WHAT IS OUT THERE?

- and how much?
- and what are the dynamics?

# Population genetics

- Study of genetic variation within and among populations
- Explained by evolutionary factors
- Based on the Hardy–Weinberg law
  - population size is large
  - mating is at random
  - mutation, selection and migration are negligible
- Else allele frequencies and genotype frequencies may change from one generation to the next.
  - allowing us to infer evolutionary patterns

# Measuring genetic variation

A bit of history

# Types of population analysis

- Allozymes
- Microsatellites
- SNPs and Indels
  - Large genomic scale
    - RADSeq
    - RAPD
    - AFLP
    - RFLP
  - Small genomic scale
    - Sequence fragments of ITS2, COI, 16S

# Allozymes

- low abundance
- low level of polymorphism

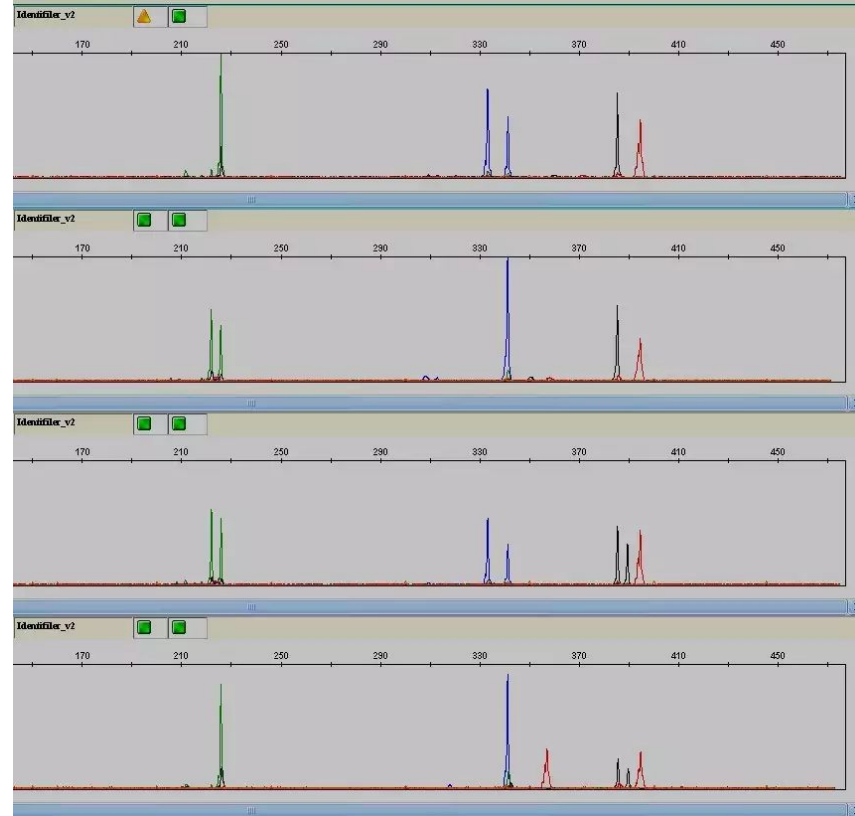

# Types of population analysis

- Allozymes
- Microsatellites
- SNPs and Indels
  - Large genomic scale
    - RADSeq
    - RAPD
    - AFLP
    - RFLP
  - Small genomic scale
    - Sequence fragments of ITS2, COI, 16S

# Microsatellites

- Very robust
- Lower resolution

# Types of population analysis

- Allozymes
- Microsatellites
- SNPs and Indels
  - Large genomic scale
    - RADSeq
    - RAPD
    - AFLP
    - RFLP
  - Small genomic scale
    - Sequence fragments of ITS2, COI, 16S

# RAD-seq

Digest hybrid genomic  
DNA (EcoRI)

Ligate P1 adaptor  
& Shear

Ligate P2 adaptor

Selectively amplify RAD tags  
& Illumina sequence

# Types of analysis

- Allozymes
- Microsatellites
- SNPs and Indels
  - Large genomic scale
    - RADSeq
    - RAPD
    - AFLP
    - RFLP
  - Small genomic scale
    - Sequence fragments of ITS2, COI, 16S, etc...

# ITS2, COI, 16S

- Resolution often issue
  - Sanger sequencing cannot detect different types of polymorphisms unless cloned
- Sequence length
  - Sanger sequencing up to 500 bp

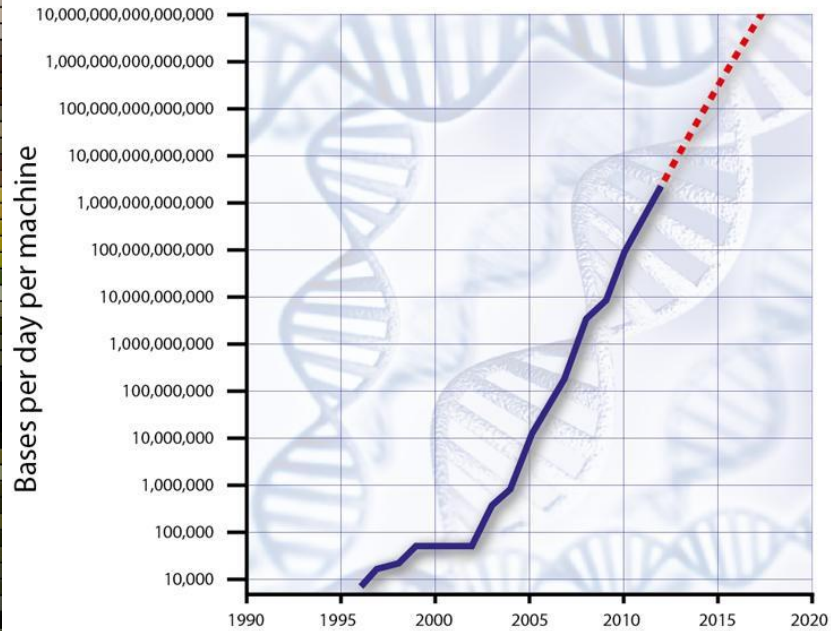

Marker	Advantages	Disadvantages
SNPs	<ul style="list-style-type: none"><li>• Low mutation rate</li><li>• High abundance</li><li>• Easy to type</li><li>• New analytical approaches are being developed at present</li><li>• Cross-study comparisons are easy; data repositories already exist</li></ul>	<ul style="list-style-type: none"><li>• Substantial rate heterogeneity among sites</li><li>• Expensive to isolate</li><li>• Ascertainment bias</li><li>• Low information content of a single SNP</li></ul>
Microsatellites	<ul style="list-style-type: none"><li>• Highly informative (large number of alleles, high heterozygosity)</li><li>• Low ascertainment bias</li><li>• Easy to isolate</li></ul>	<ul style="list-style-type: none"><li>• High mutation rate</li><li>• Complex mutation behaviour</li><li>• Not abundant enough</li><li>• Difficult to automate</li><li>• Cross-study comparisons require special preparation</li></ul>
Allozymes	<ul style="list-style-type: none"><li>• Cheap</li><li>• Universal protocols</li></ul>	<ul style="list-style-type: none"><li>• Requirement for fresh or frozen material</li><li>• Some loci show protein instability</li><li>• Limited number of available markers</li><li>• Potentially direct target of selection</li></ul>
RAPDs and derivatives	<ul style="list-style-type: none"><li>• Cheap</li><li>• Produces a large number of bands, which can then be further characterized individually (for example, converted into single locus markers)</li></ul>	<ul style="list-style-type: none"><li>• Low reproducibility</li><li>• Mainly dominant</li><li>• Difficult to analyse</li><li>• Difficult to automate</li><li>• Cross-study comparisons are difficult</li></ul>
DNA sequencing	<ul style="list-style-type: none"><li>• Highest level of resolution possible</li><li>• Not biased</li><li>• Cross-study comparisons are easy; data repositories already exist</li></ul>	<ul style="list-style-type: none"><li>• Still significantly more expensive than the other techniques</li></ul>

RAPD, randomly amplified polymorphic DNA; SNP, single nucleotide polymorphism.

# Drastic changes in sequencing technology

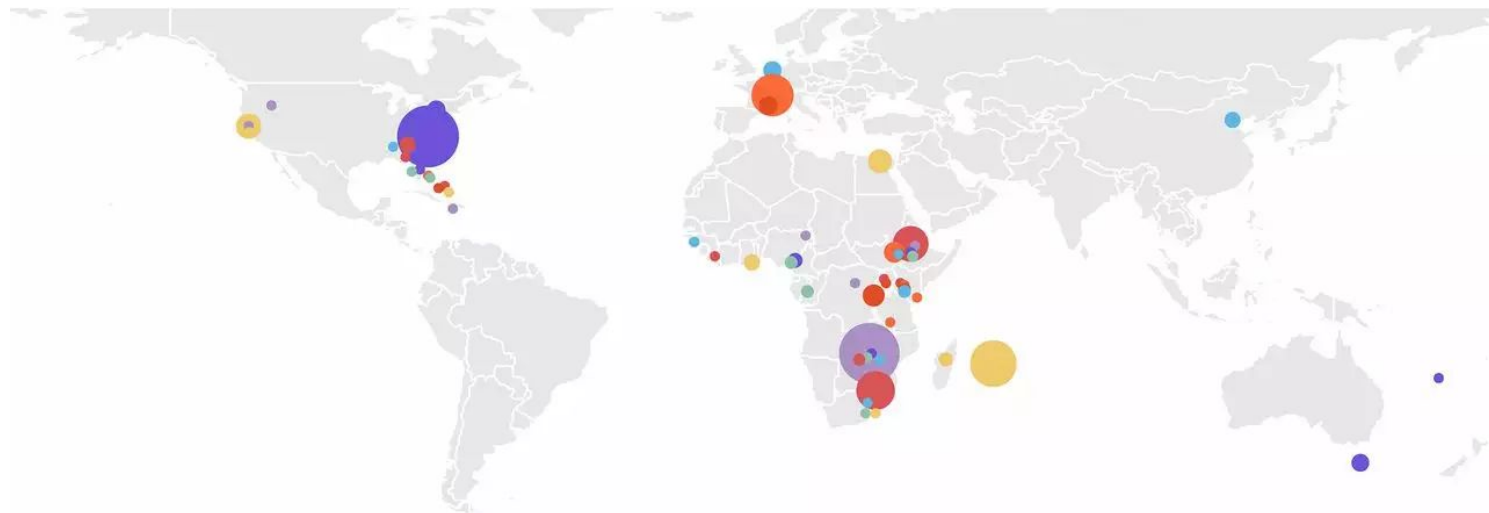

# Population genomics

- Whole individual genome comparisons would give the highest resolution
- In *D. melanogaster*, >6,000,000 natural variants (SNPs and indels) have been described (Huang et al. 2014).

# >1000 fruit fly genomes

# Sanger vs NGS

**A Single nucleotide polymorphisms**

**B Homopolymer region**

**C Dinucleotide repeat**

**D Insertion/deletion**

**E Combination**

# ONT MinION

Oxford Nanopore Technology:  
“Our goal is to enable the analysis of any living thing, by any person, in any environment.”

# In the rainforest

# What is MinION?

# Capabilities

- flow cell generates 10–20 Gb

Long reads	Real time	Easy, rapid prep	On demand	Accessible
<p>✓</p> <p>Choose your read length: 5kb? &gt;200kb? Longer?</p>	<p>✓</p> <p>Immediate access to data</p>	<p>✓</p> <p>1D library prep: &lt;10mins, 2 pots</p>	<p>✓</p> <p>Run different experiments in sequence on one flow cell</p>	<p>✓</p> <p>No capital cost</p>
<p>✓</p> <p>Easier assembly, phasing</p>	<p>✓</p> <p>Rapid time to result – move on</p>	<p>✓</p> <p>Low cost of materials</p>	<p>✓</p> <p>Barcode for even more samples</p>	<p>✓</p> <p>Easy install</p>
<p>✓</p> <p>Covering repetitive regions</p>	<p>✓</p> <p>Rapid insight into whether status of sample</p>	<p>✓</p> <p>De-skill prep</p>	<p>✓</p> <p>Run many experiments on one device</p>	<p>✓</p> <p>No additional lab infrastructure requirements</p>

## Real-time DNA barcoding in a remote rainforest using nanopore sequencing

Aaron Pomerantz, Nicolas Penafiel, Alejandro Arteaga, Lucas Bustamante, Frank Pichardo, Luis A Coloma, Cesar L Barrio-Amoros, David Salazar-Valenzuela, Stefan Prost

**doi:** <https://doi.org/10.1101/189159>

This article is a preprint and has not been peer-reviewed [what does this mean?].

## De Novo Assembly of a New *Solanum pennellii* Accession Using Nanopore Sequencing

Maximilian H.-W. Schmidt, Alexander Vogel, Alisandra K. Denton, Benjamin Istace, Alexandra Wormit, Henri van de Geest, Marie E. Bolger, Saleh Alseekh, Janina Maß, Christian Pfaff, Ulrich Schurr, Roger Chetelat, Florian Maumus, Jean-Marc Aury, Sergey Koren, Alisdair R. Fernie, Dani Zamir, Anthony M. Bolger, Björn Usadel

Published October 2017. DOI: <https://doi.org/10.1105/tpc.17.00521>  120

- Obtained an error rate of <math><0.02\%</math>
- Reached a gene completeness of 96.53%
- Complemented with Illumina sequences for polishing
- 31 flowcells yielded 134.8 Gb of data in total,
- 110.96 Gb (representing ~100-fold coverage) after filtering
- Total yield per flowcell varied 0.96 and 6.02 Gb after filtering.
